

Serial No. 10/523,844
67222-001AMENDMENTIN THE CLAIMS:

1. (CURRENTLY AMENDED) A wafer rotating device to rotate a disk-shaped wafer having a top surface, a bottom surface and a circumferential surface, the wafer rotating device comprising:

at least three rollers rotatably provided about axes arranged at parallel intervals, wherein each of the at least three rollers has a cylindrical surface which contacts the circumferential surface of a disk-shaped the wafer;

a rotation drive mechanism that rotates and drives at least one of the rollers;

an interval adjustment mechanism capable of adjusting dimensions of the intervals of the rollers; and

a load control device that controls a load applied from the rollers to the wafer in a radial direction of the wafer when the wafer is clamped between the rollers; and

a load cell provided in the interval adjustment mechanism that detects the load applied to the rollers along a direction of movement of the rollers, wherein the load cell detects a contact load between the cylindrical surfaces of the rollers and the circumferential surface of the wafer when the wafer is clamped between the rollers,

~~wherein the wafer rotating device supports and rotates the wafer by a frictional force proportional to a contact load between the cylindrical surfaces of the rollers and the circumferential surface of the wafer, and~~

~~wherein the wafer includes a top surface and a bottom surface, and the wafer is rotated without any contact on the top surface and the bottom surface~~

wherein the load control device controls the interval adjustment mechanism so that the contact load detected by the load cell is maintained constant,

wherein the interval adjustment mechanism adjusts the dimensions of the intervals of the rollers so that only the circumferential surface of the wafer is supported by a frictional force that is proportional to the contact load and so that the wafer is stably held at a position in a direction of height of at least one of the cylindrical surfaces while balancing gravity and the frictional force, and

wherein the rotation drive mechanism rotates and drives at least one of the rollers to rotate the wafer without making any contact with the top surface and the bottom surface.

2. (CANCELLED)

3. (PREVIOUSLY PRESENTED) The wafer rotating device according to claim 1 wherein the rollers are rotatably provided around the axes which are arranged roughly in a vertical direction, and the rollers include a flange section, wherein the flange section has a diameter larger than the cylindrical surface of the rollers, and the flange section is provided below the cylindrical surface which clamps the wafer, and the flange section has an inclined surface in which an upper surface of the flange section gradually becomes lower moving towards an outside in a radial direction.

4. (PREVIOUSLY PRESENTED) The wafer rotating device according to claim 1 wherein an angle between two of the rollers adjacent to one of the rollers and on both sides of the one of the rollers is smaller than 180° .

5. (PREVIOUSLY PRESENTED) The wafer rotating device according to claim 4 wherein pairs of rollers are arranged at three or more locations at intervals in a circumferential direction of the wafer.

Serial No. 10/523,844
67222-001

6. (CURRENTLY AMENDED) An edge flaw inspection device comprising:
- a wafer rotating device which rotates a disk-shaped wafer having a top surface, a bottom surface and a circumferential surface, the wafer rotating device including:
- at least three rollers rotatably provided about axes arranged at parallel intervals, wherein each of the rollers has a cylindrical surface which contacts ~~a~~ the circumferential surface of ~~a disk-shaped~~ the wafer,
 - a rotation drive mechanism that rotates and drives at least one of the rollers;
 - an interval adjustment mechanism capable of adjusting dimensions of the intervals of the rollers, and
 - a load control device that controls a load applied from the rollers to the wafer in a radial direction of the wafer when the wafer is clamped between the rollers,
 - a load cell provided in the interval adjustment mechanism that detects the load applied to the rollers along a direction of movement of the rollers, wherein the load cell detects a contact load between the cylindrical surfaces of the rollers and the circumferential surface of the wafer when the wafer is clamped between the rollers, wherein the wafer rotating device supports and rotates the wafer by a frictional force proportional to a contact load between the cylindrical surfaces of the rollers and the circumferential surface of the wafer, wherein the wafer includes a top surface and a bottom surface, and the wafer is rotated without any contact on the top surface and the bottom surface
 - a light source that radiates light onto the circumferential surface of ~~a~~ the wafer supported by the wafer rotating device; and
 - a light detector that detects the light that has been radiated from the light source which is reflected on the circumferential surface of the wafer,
 - wherein the load control device controls the interval adjustment mechanism so that the contact load detected by the load cell is maintained constant,
 - wherein the interval adjustment mechanism adjusts the dimensions of the intervals of the rollers so that only the circumferential surface of the wafer is supported by a frictional force that is proportional to the contact load and so that the wafer is stably held at a position in a direction of height of at least one of the cylindrical surfaces while balancing gravity and the frictional force, and
 - wherein the rotation drive mechanism rotates and drives at least one of the rollers to rotate the wafer without making any contact with the top surface and the bottom surface.
